# Search and Real Time Analytics on Big Data

---

Ryan Tabora - Jason Rutherford

---

Tuesday, February 26, 13

# Who are we?

---

## Ryan Tabora

- Big Data Consultant
  - Co-author of Lucene and Solr: The Definitive Guide from O'Reilly
  - Think Big Analytics
- 

## Jason Rutherford

- Co-author of *Programming Hive* and *Lucene and Solr: The Definitive Guide* from O'Reilly
- Search, mobile, Hadoop, cryptography, natural language processing, security, Hive
- Works on Datastax Enterprise

Tuesday, February 26, 13

Ryan + Jason

# The Plan

---

1. Real Time Analytics
2. Search with Big Data
3. Product Landscape
4. Lucene and Solr Deep Dive
5. Scaling Search
6. Search with NoSQL
7. Example Use Case
8. Performance Tuning

---

Tuesday, February 26, 13

Ryan

# About the Exercises

---

- Unix, Java, UI Based Exercises
- All Java projects are Mavenized (Maven 3.0 needed)
- Can be downloaded from S3 <https://s3.amazonaws.com/thinkbig-academy/Strata2013/RealTimeSearchAndAnalytics-master.zip>
- View the README files for detailed instructions
- Most exercises are intended to be run on the student's local environment

---

Tuesday, February 26, 13

Ryan

---

# Realtime Analytics

---

Search and Real Time Analytics on Big Data

---

Tuesday, February 26, 13

Jason

# Lucene and Solr do more than search

---

- Realtime analytics
- Numerical calculations
- Sorting
- Grouping
- Aggregations
- Custom scoring
- Text search
- Fast and scalable
- Near realtime

---

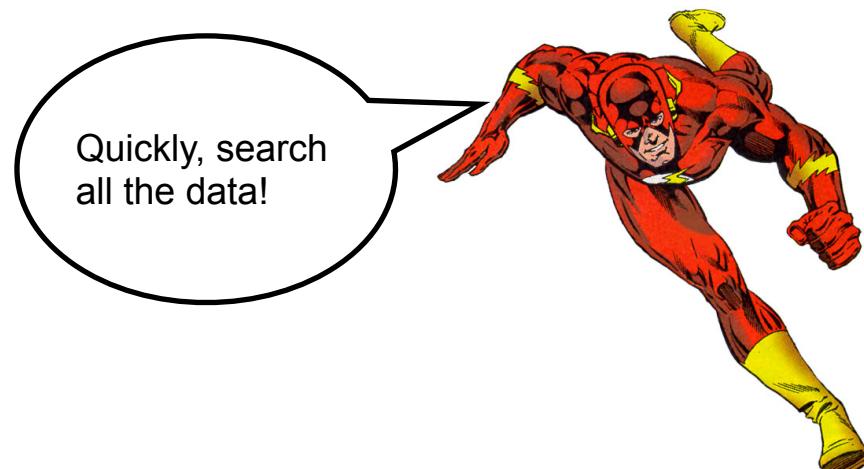

Tuesday, February 26, 13

Jason

# What is Real Time Search?

---

- Low latency
  - Query Response
  - Data Availability
  - End-to-end response
- Could be nanoseconds, milliseconds, seconds, or minutes depending on your problem.

Tuesday, February 26, 13

Jason

# What is Big Data?

---

- The Buzz
  - “Big Data is the frontier of a firm's ability to store, process, and access the data it needs to operate effectively, make decisions, reduce risks, and serve customers.” [1]
  - Of course: The V’s (Volume, Velocity, Variety)
- The Reality
  - Data so big or analysis so compute intensive that traditional approaches can’t scale well or cheaply enough.

[1] [http://blogs.forrester.com/mike\\_gualtieri/12-12-05-the\\_pragmatic\\_definition\\_of\\_big\\_data](http://blogs.forrester.com/mike_gualtieri/12-12-05-the_pragmatic_definition_of_big_data)

---

Tuesday, February 26, 13

Jason

# Explore Data in Realtime

---

- Lucene and Solr enable exploration of big data sets in realtime today
- Hive and MapReduce are batch oriented

---

Tuesday, February 26, 13

Jason

# Real World Example: Tick Data

---

- Details about every trade
- Tick data generated real time and is quantitatively query-able
- Too big to query on in real time? Not anymore!

---

Tuesday, February 26, 13

Jason

image src: [http://25.media.tumblr.com/tumblr\\_mcmh3o1ktz1qj5rko1\\_500.jpg](http://25.media.tumblr.com/tumblr_mcmh3o1ktz1qj5rko1_500.jpg)

- U.S. stock ticker equities data
- Search on symbols
- Search on company reports
- Ticker data arrives in realtime and is quantitatively query-able
- Query on multiple stocks
- Query back in time 10 years
- Make all ticket data available to customers, only possible with Big Data
- Why use search instead of raw NoSQL or Complex Event Processing?
- Quantitative analysis
- Average for a group of stocks over 5 years

# Tick Data Analytics - Moving Average

---

- Computing the moving stock price average in real time
- Comparing multiple moving averages for different stock\_symbols
- Requires statistical analysis, group by companies, and faceting features

---

Tuesday, February 26, 13

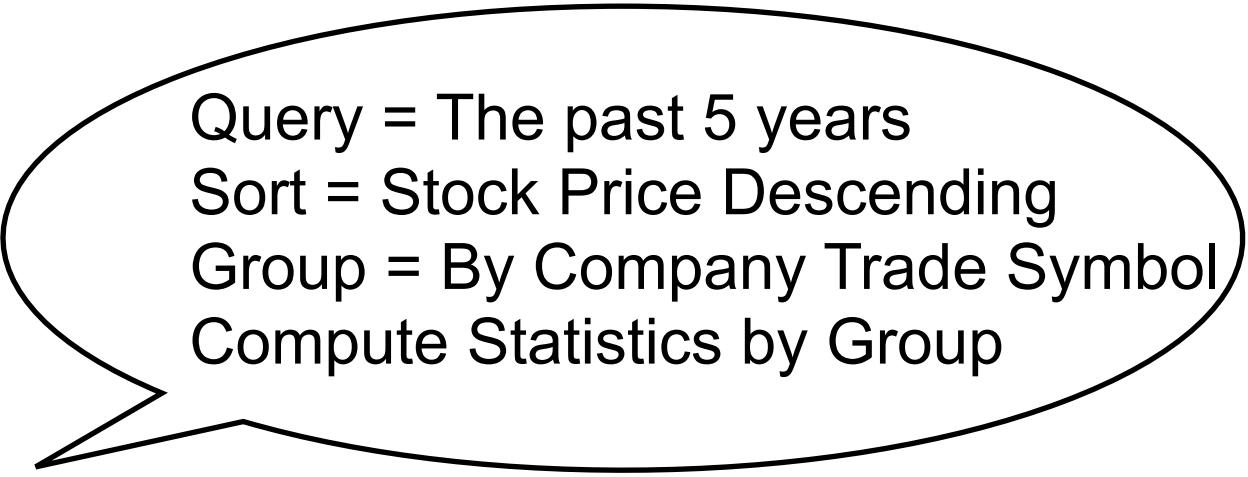

Jason

img src: [http://www.trading-plan.com/images/moving\\_average\\_1.gif](http://www.trading-plan.com/images/moving_average_1.gif)

# Tick Data Analytics - Ad Hoc Searches

---

- Read latest ticks for a given company
- Query ticks for companies in specific verticals during large events such as press releases
- Compute deviation of stock data over 5 years for groups of companies

Query = The past 5 years  
Sort = Stock Price Descending  
Group = By Company Trade Symbol  
Compute Statistics by Group

---

Tuesday, February 26, 13

Jason

# SQL Queries possible with Solr

---

- `SELECT stock_symbol, AVG(stock_price_open) FROM stocks GROUP BY stock_symbol`
- Group by a stock symbol with an average aggregation
- No joins of any kind, use Hive or de-normalize the data if you need joins

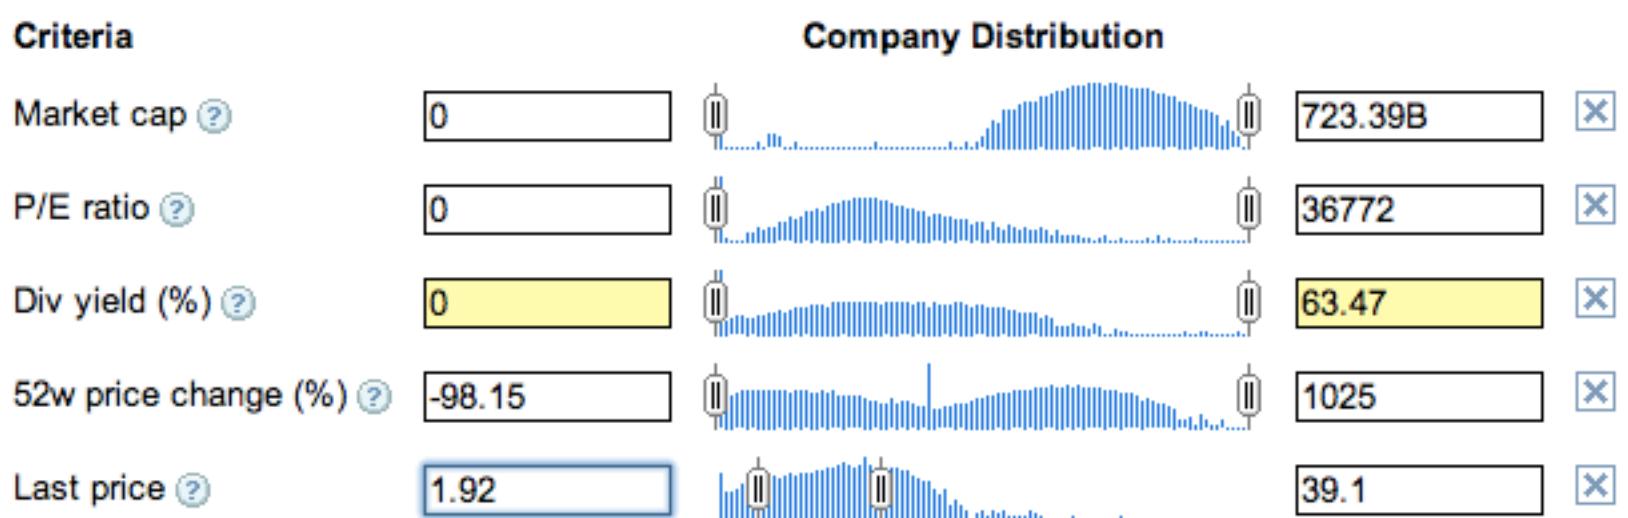

---

Tuesday, February 26, 13

Jason

# SQL Queries possible with Solr

- `SELECT * FROM stocks WHERE stock_symbol = 'QTM' AND (stock_price_open <= 2.64 AND stock_price_open >= 2.38)`
- Get stock rows where the symbol and stock open price ranges are set

Tuesday, February 26, 13

Jason

src: Google Finance

# SQL Queries possible with Solr

---

- SELECT \* FROM stocks WHERE NOT stock\_price\_open IS NULL AND stock\_symbol = 'QTM' ORDER BY stock\_price\_open DESC
- Get stock rows where the symbol is set, and sort by the stock price descending

Company name	Symbol	Currency	Market cap	P/E ratio	Div yield (%)	52w price change (%)	▼ Last price
Huntington Bancshares Incorporated - Non Cumulative Perp Conv Pfd Ser A	HBANP	\$	511.37M	-	-	-	1,280.00

# SQL Queries possible with Solr

---

- `SELECT COUNT(*) FROM stocks WHERE stock_symbol = 'QRR' AND (ddate <= '2007-03-06' AND ddate >= '2007-02-27')`
- Get the count for a given stock and a date range

Tuesday, February 26, 13

Jason

SRC: <http://sbml.org/images/f/fc/Sbml-tool-count-graph.png>

# Real Time Demo Data

---

```
exchange,  
stock_symbol,  
date,  
stock_price_open,  
stock_price_high,  
stock_price_low,  
stock_price_close,  
stock_volume,  
stock_price_adj_close
```

```
NASDAQ,ABXA,2009-12-09,2.55,2.77,2.50,2.67,158500,2.67  
NASDAQ,ABXA,2009-12-08,2.71,2.74,2.52,2.55,131700,2.55  
NASDAQ,ABXA,2009-12-07,2.65,2.76,2.65,2.71,174200,2.71  
NASDAQ,ABXA,2009-12-04,2.63,2.66,2.53,2.65,230900,2.65  
NASDAQ,ABXA,2009-12-03,2.55,2.62,2.51,2.60,360900,2.60
```

---

Tuesday, February 26, 13

Jason

# Field Types

---

```
<fieldType name="int" class="solr.TrieIntField"/>
<fieldType name="float" class="solr.TrieFloatField"/>
<fieldType name="long" class="solr.TrieLongField"/>
<fieldType name="double" class="solr.TrieDoubleField"/>
<fieldType name="date" class="solr.TrieDateField"/>
```

- Fields that enable range queries
- Numeric function queries
- Sorting
- Aggregations such as  
AVG,COUNT,SUM,MIN,MAX,STDEV
- Programmable statistics based calculations
- Programmable scoring (this is what text search does very very well)

---

Tuesday, February 26, 13

Jason

# Text/Date Based Fields

---

```
<field name="rowkey" type="string" indexed="true"  
stored="true"/>  
<field name="exchange" type="string" indexed="true"  
stored="true"/>  
<field name="stock_symbol" type="string"  
indexed="true" stored="true"/>  
<field name="date" type="date" indexed="true"  
stored="true"/>
```

---

Tuesday, February 26, 13

Jason

# Numeric Fields

---

```
<field name="stock_price_open" type="float"  
indexed="true" stored="true"/>  
  <field name="stock_price_high" type="float"  
indexed="true" stored="true"/>  
    <field name="stock_price_low" type="float"  
indexed="true" stored="true"/>  
      <field name="stock_price_close" type="float"  
indexed="true" stored="true"/>  
        <field name="stock_volume" type="float"  
indexed="true" stored="true"/>  
          <field name="stock_price_adj_close" type="float"  
indexed="true" stored="true"/>  
            <field name="dividends" type="float" indexed="true"  
stored="true"/>
```

# What Does Search Mean?

---

- Querying terms that are not the unique identifier or key
- Inverted Index

Tuesday, February 26, 13

Ryan

An inverted index is like the index in the back of the book. Its a list of terms that point to pages in the book.

Tuesday, February 26, 13

Ryan

Faceting is an extremely powerful form of search that many take for granted. CNet whom you will learn helped create Solr pioneered faceting.

# What Can You Do With Search?

- Text Search
- Github code search, Google, etc

The screenshot shows a GitHub repository page for 'ThinkBigAnalytics / Academy-Courses'. The search bar at the top contains the query 'HBaseConfiguration.create()'. Below the search bar, there are tabs for Code, Network, Pull Requests (0), Issues (0), Wiki, and Graphs. The 'Code' tab is selected. The search results show two occurrences of the code in different files:

- HBase/exercises/hbase/10-hbase-avro-ave-high/README.html**: Line 149 contains the code `hbaseConfiguration = HBaseConfiguration.create();`.
- HBase/exercises/hbase/10-hbase-avro-ave-high/README.md**: Line 146 contains the code `hbaseConfiguration = HBaseConfiguration.create();`.

Tuesday, February 26, 13

Ryan

Tokenized search is just a small piece of search, there is much more you can do with text based search. More on this later.

# What Can You Do With Search?

---

- Image
- Google, Tineye

A screenshot of a Google Images search results page. The search query in the bar is "whoisthis.jpg". Below the search bar, the "Images" tab is selected, along with "Web", "Maps", "Shopping", "More", and "Search tools". A message indicates "About 178 results (0.37 seconds)". The first result is a thumbnail of a man with dark hair, identified as Geddy Lee. To the right of the thumbnail, it says "Image size: 365 × 365" and "Find other sizes of this image: All sizes - Small - Medium". Below the thumbnail, the text "Best guess for this image: [geddy lee](#)" is displayed. The link leads to the Wikipedia page for Geddy Lee, with the URL "en.wikipedia.org/wiki/Geddy\_Lee". The page summary describes Geddy Lee Weinrib, OC, born Gary Lee Weinrib on July 29, 1953, as a Canadian musician, lead vocalist, and bassist.

Moving the map in Yelp to query which restaurants are where

# Where is Search in NoSQL?

---

- Many popular NoSQL datastores have limited or no search capability at all
- HBase scan/get by rowkey
- Cassandra secondary indexing

---

Tuesday, February 26, 13

Ryan

# We Want Our SQL Back!

---

- Hive provides SQL like queries over data in HDFS (and others) via MapReduce
- Hive allows users to JOIN data
- But Hive is batch oriented

---

Tuesday, February 26, 13

Ryan

# Solr Query Features

---

- Search on any number of fields with boolean logic (AND, OR + -)
- Sort results per field similar to SQL
- Range queries
- Phrase queries
- Regular expression queries
- Query boosting (DisMax)

---

Tuesday, February 26, 13

Jason

# Basic Queries

---

- Select All Query
  - ▶ q=\*:\*
  - ▶ **SQL:** SELECT \* FROM core
- Single term query
  - ▶ q=name:ryan
  - ▶ **SQL:** SELECT \* FROM core WHERE name = 'ryan'
- Multiple Fields
  - ▶ q=(+first\_name:ryan +last\_name:tabora)
  - ▶ **SQL:** SELECT \* FROM core WHERE first\_name = 'ryan' AND last\_name = 'tabora'

---

Tuesday, February 26, 13

Jason

# And Or Not Logic

---

- **And** logic - Name field containing both tokens
  - ▶ q=name:(+rick +grimes)
  - ▶ **SQL:**... WHERE name = 'rick' AND name = 'grimes'
- **Or** logic - Subject field containing either token
  - ▶ q=subject:(pirates zombies)
  - ▶ **SQL:**... WHERE subject = 'pirates' OR subject = 'zombies'
- **Not** logic - Query for the test\_results field that do not included the token pass
  - ▶ q=-test\_results:pass
  - ▶ **SQL:**... WHERE NOT test\_results = 'pass'

---

Tuesday, February 26, 13

Jason

# Range Queries

---

- Query a **numerical range**
  - ▶ salary:[100000 TO 150000]
  - ▶ **SQL:** ... WHERE salary >= 100000 AND salary <= 150000
- Query **from** a start date **to anything beyond it**
  - ▶ date:[1999091091T23:59:59.999Z TO \*]
  - ▶ **SQL:** ... WHERE date >= 1999091091T23:59:59.999Z

---

Tuesday, February 26, 13

Jason

# Range Queries (Continued)

---

- Query for **anything lower** than a number
  - ▶ stock\_price\_close:[\* to 10]
  - ▶ **SQL:**... WHERE stock\_price\_close <= 10
- Query for any document **without a value** for the field
  - ▶ -amount\_paid:[\* TO \*]
  - ▶ **SQL:** WHERE amount\_paid IS NULL

---

Tuesday, February 26, 13

Jason

# Sort By

---

- Get the **latest** critical documents
  - ▶ `q=priority:critical&sort=true&sort.field=date desc`
  - ▶ **SQL:** `WHERE priority = 'critical' ORDER BY date DESC`
- Get a list of students sorted **alphabetically**
  - ▶ `q=role:student&sort=true&sort.field=last_name asc`
  - ▶ **SQL:** `WHERE role = 'student' ORDER BY last_name ASC`
- Get the **highest** traded stock **values** for the day
  - ▶ `q=stock_symbol:NYSE&sort=true&sort.field=stock_price_close desc`
  - ▶ **SQL:** `WHERE stock_symbol = 'NYSE' ORDER BY stock_price_close DESC`

---

Tuesday, February 26, 13

Jason

# Group by (and group sorting)

---

- Query on all disk **devices grouped by server\_id**
  - ▶ q=device\_type=disk&group=true&group.field=server\_id
  - ▶ **SQL:** WHERE device\_type = 'disk' GROUP BY server\_id
- Query on all **companies sorted alphabetically**, and **documents sorted by date**
  - ▶ q=state:wisconsin&group=true&group.field=company\_name&group.sort=date desc&sort=company\_name desc
  - ▶ **SQL:** WHERE state = 'wisconsin' GROUP BY company\_name ORDER BY company\_name, date DESC

Tuesday, February 26, 13

Jason

# Group by StatsComponent

---

- StatsComponent with facets enables group by with aggregations
- Does not support ordering of the grouping
- Query on all stock prices **grouped by** stock\_symbol with all aggregations including average, sum, count
  - ▶ stats=true&stats.field=stock\_price\_open&stats.facet=stock\_symbol&q=\*:\*
  - ▶ **SQL:** FROM stocks GROUP BY stock\_symbol
  - ▶ **SQL:** SELECT stock\_symbol, SUM(stock\_price\_open) FROM stocks GROUP BY stock\_symbol
  - ▶ **SQL:** SELECT stock\_symbol, COUNT(stock\_price\_open) FROM stocks GROUP BY stock\_symbol

Tuesday, February 26, 13

Jason

# Filter Queries

---

- Cached bit sets
- No score calculated
- Good for queries that are reused such as types or **access controls**
  - ▶ `q=product_name:necronomicon&fq=customer_id:s-mart`

---

Tuesday, February 26, 13

Jason

# Phrase Query

---

- Search for “big” and “data” within 4 words of each other
  - ▶ “big data”~4

---

Tuesday, February 26, 13

Jason

# Prefix Queries

---

- Find all monster types starting with DRA
  - ▶ q=monster\_type:DRA\*
  - ▶ Results = DRAGON, DRACULA, etc.
  - ▶ **SQL:** ... WHERE monster\_type LIKE 'DRA%'
- Queries cannot begin with an asterisk

---

Tuesday, February 26, 13

Jason

# Regular Expressions

---

- Use forward slash to demarcate a regex query
- Match on a five digit zip code
  - ▶ body:/[0-9]{5}/

---

Tuesday, February 26, 13

Jason

# Facets

- Intersection count of another query
- Commonly seen on shopping and other web sites
- Solr supports multi-select facetting
- Range facetting

---

# Product Landscape

---

Search and Real Time Analytics on Big Data

---

Tuesday, February 26, 13

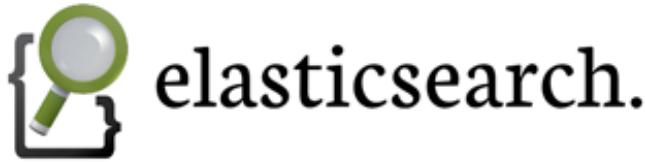

So lets talk about some of the search technologies that might help us get there.

# Search Landscape

---

Custom

Amazon CloudSearch

---

Tuesday, February 26, 13

Jason

We can broadly categorize the search landscape into two groups. Lucene based and non-Lucene based. In this talk we are going to focus on the Lucene based solutions.

# Open Source Options

---

- Java Based
- Search Engine
- Highly Customizable

- Java Based
- Search Server
- Based on Lucene
- Distributed

- Based on Lucene
- Ease of deployment
- JSON based API
- Similar search feature set to Solr

Tuesday, February 26, 13

Jason

Elastic Search is the main competitor for Solr, and its founded on bringing up a distributed cluster with as much ease as possible. With SolrCloud, Solr and ElasticSearch have very similar feature sets.

# Commercial Lucene-Based Options

---

LucidWorks™

- Integrates Solr and Cassandra
- Lucene index stored locally on each node
- Raw data in Cassandra for reindexing/replication
- Multiple datacenters
- Security
- Based on SolrCloud
- Solr committers
- Connectors to multiple data sources
- Security

---

Tuesday, February 26, 13

Jason

Some projects we've heard of:

Cloudera + Solr

MapR + LucidWorks

Greenplum/Pivotal Labs + Solr

# Non-Lucene Based Options

---

Amazon CloudSearch

- Makes Hadoop, S3 & HBase searchable
- Builds indexes using Hadoop MapReduce
- Stores indexes on HDFS, S3 or HBase
- Query with a thin client runtime
- Cloud (AWS) or On-Prem deployment options
- Beta release stage

- A distributed, full-text search engine that is built on Riak Core
- Index Riak KV objects as they're written using a precommit hook.
- Support various MIME types (e.g., JSON, XML, text)
- facets, highlighting, custom scripts features
- Focus on real-time aspect
- Term-based partitioning (a.k.a, global indexing)

- Fully-managed search service in the cloud
- Leverages A9.com search technology
- Users
  - 1) Create a search domain
  - 2) Configure your search fields
  - 3) Upload your data for indexing
  - 4) Submit search requests from your web site or application

---

Tuesday, February 26, 13

# Storing the Data

---

- Distributed big data processing framework
  - Batch Oriented
  - MapReduce
- NoSQL Datastore
  - Based on Hadoop
  - Master slave architecture
  - Real time random data access
  - Lookup by rowkey only
  - Efficient scans
  - MapReduce
- NoSQL Datastore
  - Peer to peer architecture
  - Real time random data access
  - Secondary indexing
  - User configurable CAP tradeoffs

---

# Lucene and Solr Deep Dive

---

Search and Real Time Analytics on Big Data

---

Tuesday, February 26, 13

# First - Lucene

---

- High performance inverted index
- Java based
- Embeddable library
- Collection of jar files

---

Tuesday, February 26, 13

Jason

Solr is an Apache licensed search server with Lucene at the core. Where Lucene is a search library with no dependencies, Solr has dependencies on other libraries. The default method of running Solr is as a J2EE web application, however Solr may also be embedded in other Java applications.

# History of Lucene

---

- Started by Doug Cutting in 1999, Apache Lucene later became a top-level Apache project in February of 2005.
- Used as a part of Nutch (web crawler).

---

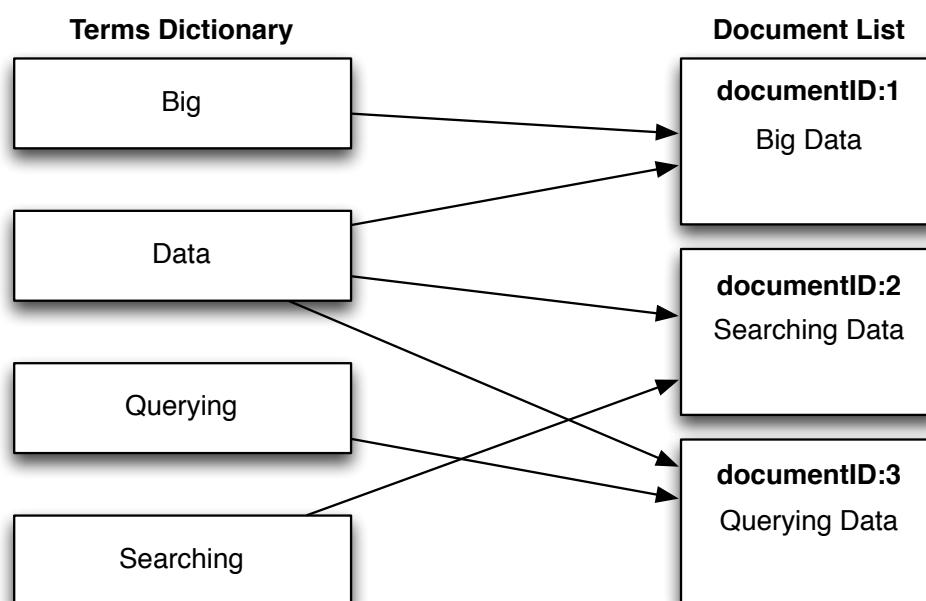

Tuesday, February 26, 13

Jason

# Indexing Basics - Lucene Segments

---

- Lucene stores the index in discrete units called segments
- Each segment is a complete index in itself
- Segments contain an inverted index

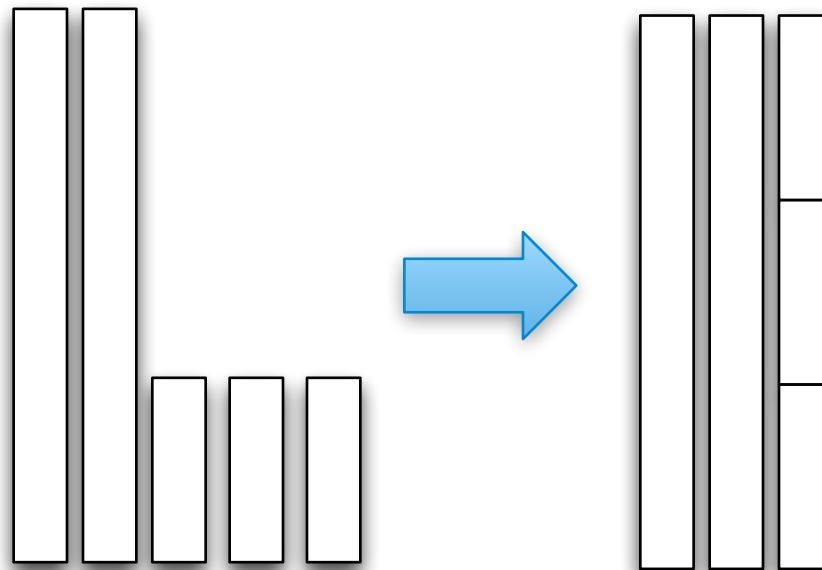

Tuesday, February 26, 13

Jason

# Lucene File System

---

- Log structured merge tree
- Written once and immutable
- Segments merge as the index grows

Tuesday, February 26, 13

Jason

[http://www.youtube.com/watch?v=YW0bOvLp72E&feature=player\\_embedded](http://www.youtube.com/watch?v=YW0bOvLp72E&feature=player_embedded)

# Lucene Documents

---

- Essentially a collection of fields
- Field consists of a Field Type, Name, and Value
- Field Types include...
  - IntField
  - ByteDocValuesField
  - TextField
  - StringField
  - StoredField
  - ...

---

Tuesday, February 26, 13

Jason

Expert: directly create a field for a document. Most users should use one of the sugar subclasses: IntField, LongField, FloatField, DoubleField, ByteDocValuesField, ShortDocValuesField, IntDocValuesField, LongDocValuesField, PackedLongDocValuesField, FloatDocValuesField, DoubleDocValuesField, SortedBytesDocValuesField, DerefBytesDocValuesField, StraightBytesDocValuesField, StringField, TextField, StoredField.

A field is a section of a Document. Each field has three parts: name, type and value. Values may be text (String, Reader or pre-analyzed TokenStream), binary (byte[]), or numeric (a Number). Fields are optionally stored in the index, so that they may be returned with hits on the document.

# Analyzers

---

- Convert text into tokens
- Records the position of each token
- Filters tokens as per configuration/design
- Can be applied when text is indexed or queried
  - Ex. Indexed as lower cased, queries lower cased at query time

---

Tuesday, February 26, 13

Jason

# Analyzers Components

---

- Character Filters
  - ▶ Transformations before tokenizing
- Tokenizer
  - ▶ Breaks text into terms
- Token Filters
  - ▶ Transformations on the output of the tokenizer

---

Tuesday, February 26, 13

Jason

Tokenizer: Breaks the long string of input into discrete chunks or terms.

Character filters: Performs character transformations on the raw input string before it is tokenized.

Token Filter: Performs one transformation on the stream of tokens output by the tokenizer, each executed in the order specified.

# Analyzers Use Cases

---

- Stemming - beyond simple plurals, including identification of root words
- Stop word removal - to reduce the size of the index and improve matching of similar text
- Eliminating accent marks for non-English text
- Arbitrary transformations using regular expressions
- Splitting terms based on
  - Embedded punctuation
  - Case changes
  - Changes between letters and digits

Tuesday, February 26, 13

Jason

# Provided Filters and Tokenizers

---

Some simple ones are:

- WhitespaceTokenizer
- StopFilter
- LowerCaseFilter
- StandardTokenizer

---

Tuesday, February 26, 13

Jason

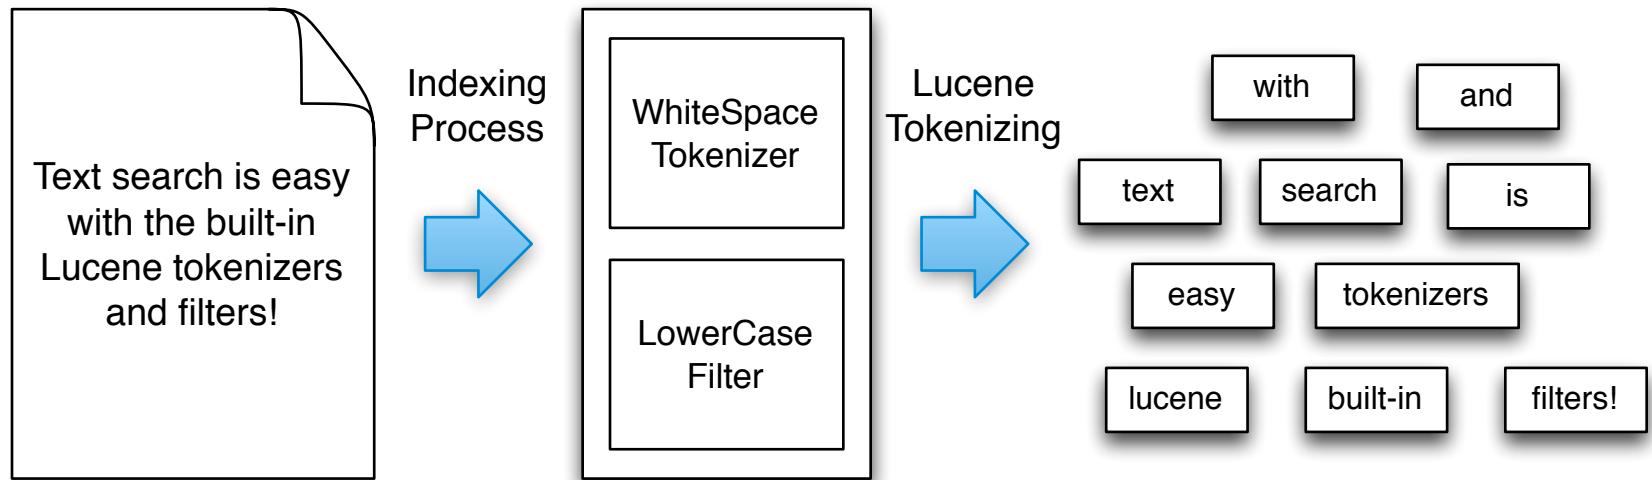

## CommonGrams

Construct bigrams for frequently occurring terms while indexing. Single terms are still indexed too, with bigrams overlaid. This is achieved through the use of [`PositionIncrementAttribute.setPositionIncrement\(int\)`](#). Bigrams have a type of [`GRAM\_TYPE`](#) Example:

- input:"the quick brown fox"
- output:["the","the-quick"]|["brown"]|["fox"]
- "the-quick" has a position increment of 0 so it is in the same position as "the" "the-quick" has a term.type() of "gram"

# Analyzers Example

---

Tuesday, February 26, 13

Jason

# Lucene IndexWriters and Directories

---

- IndexWriters create the index (Lucene Segments)
- Directories represent the location of the Lucene index
  - ▶ FSDirectory
  - ▶ RAMDirectory
  - ▶ NRTCachingDirectory
- All IO goes through Directory

---

Tuesday, February 26, 13

Jason

NRT Caching Directory: This class is likely only useful in a near-real-time context, where indexing rate is lowish but reopen rate is highish, resulting in many tiny files being written. This directory keeps such segments (as well as the segments produced by merging them, as long as they are small enough), in RAM.

# Query Types

---

Query Name	Description
TermQuery	Matching a term
BooleanQuery	AND, OR NOT Functionality
WildcardQuery	Searching with W*LDCARD*
PhraseQuery	Searching for a Sequence of Terms
PrefixQuery	Searching for Pre*
FuzzyQuery	Searching for Like Terms
RegexpQuery	Regular Expression Matches
NumericRangeQuery	Self Explanatory
...	...

---

Tuesday, February 26, 13

Jason

# Scoring Document Results

---

- Default Lucene scoring is TF/IDF
- Term frequency / inverse document frequency
- Other scoring functions are built in such as BM25, and many others
- Lucene enables custom scoring functions
- Use case is implementing custom financial scoring algorithms (such as square root and log analysis)

---

Tuesday, February 26, 13

# Core Solr Features

---

- Schema
- Extensions to Lucene Query Language
- Realtime Statistics
- Geospatial Search
- Advanced Text Analysis
- Web Administrative GUI
- Distributed Search
- JSON, XML, CSV support
- REST API

---

Tuesday, February 26, 13

Ryan

Automatic, manual, and configurable relevancy boosting, including complex function queries

Schema for declaring and managing data and document structure, fields, and field types

Typed dynamic fields in addition to fully-typed schema

Optional “passthrough” so that undeclared data can be supported, if needed for the application

Multiple indexes (collections or tables) in a single server

Sorting

Faceting

Highlighting of document snippets

Result Grouping and field\*based collapsing of search results

Spellcheck

Autocomplete

More Like This (Find Similar)

Debugging

Statistics

Term analysis

Extraction of data from rich text documents (Office, PDF, web pages) using

Apache Tika

Extensive caching support

Powerful text analysis for both indexing and query

Distributed indexing and queries with partitioning/shards and replication for scaling

Geospatial search

# Solr Benefits

---

- Open Source
- Cheap (free)
- It scales to billions of documents
- Optimized for high-volume Web traffic
- Fast (extensive performance optimizations)
- Java Based
- Commercial vendors providing training, support, and consulting for corporate customers

---

# Schema Type Options

---

- DynamicFields
  - ▶ Flexible schema
- CopyFields
  - ▶ Different analyzers for same field
- Field types
  - ▶ Strings
  - ▶ Integers
  - ▶ Dates
  - ▶ Trie fields
  - ▶ ...

Tuesday, February 26, 13

Ryan

The schema also provides the ability to copy fields so that the same data can be indexed in different ways, or to be able to more efficiently search a number of fields by automatically copying them into a single search field.

Solr also permits dynamic fields, allowing the developer to automatically associate various field types with dynamic field names based on prefix and suffix patterns. The developer can choose whether to allow such fields, as well as whether to allow dynamic fields with arbitrary names.

The Solr schema file for a collection primarily details the fields and their field types. In other words, what does the data look like and how is it organized.

Solr comes with a number of built-in data types, including strings, integers, floating point, date, boolean, and text. There are specialized forms for many of the built-in types.

Developers can also add their own field types by developing plug-ins in Java.

The text field type (actually, a whole family of types) is special in that a variety of transformations are

# Advanced Schema Types

---

- Custom Field Types
- Text Fields
- Analyzers
  - ▶ Tokenizers
  - ▶ Filters

---

Tuesday, February 26, 13

Ryan

# Changing the Schema

---

- Adding fields is okay
- Changing existing fields requires a complete reindex
  - ▶ Think new analyzers, tokenizers, filters
- Can be costly
  - ▶ Time to develop custom reindexing application
  - ▶ Time to actually perform the reindexing

---

# Solr as a Database?

---

- Indexed vs. Stored
  - Retrieving stored fields can be expensive
- Stores the raw data alongside the index
- Storing entire text blocks could impact query performance

---

Tuesday, February 26, 13

Ryan

Solr will store the actual raw data alongside the index if you want, however this can greatly increase your storage profile as well as your response times (sending more data over the wire)

There are tradeoffs, storing little bits of the raw data can be good. Storing entire text blocks could be detrimental to your application.

---

# Scaling Search

---

Search and Real Time Analytics on Big Data

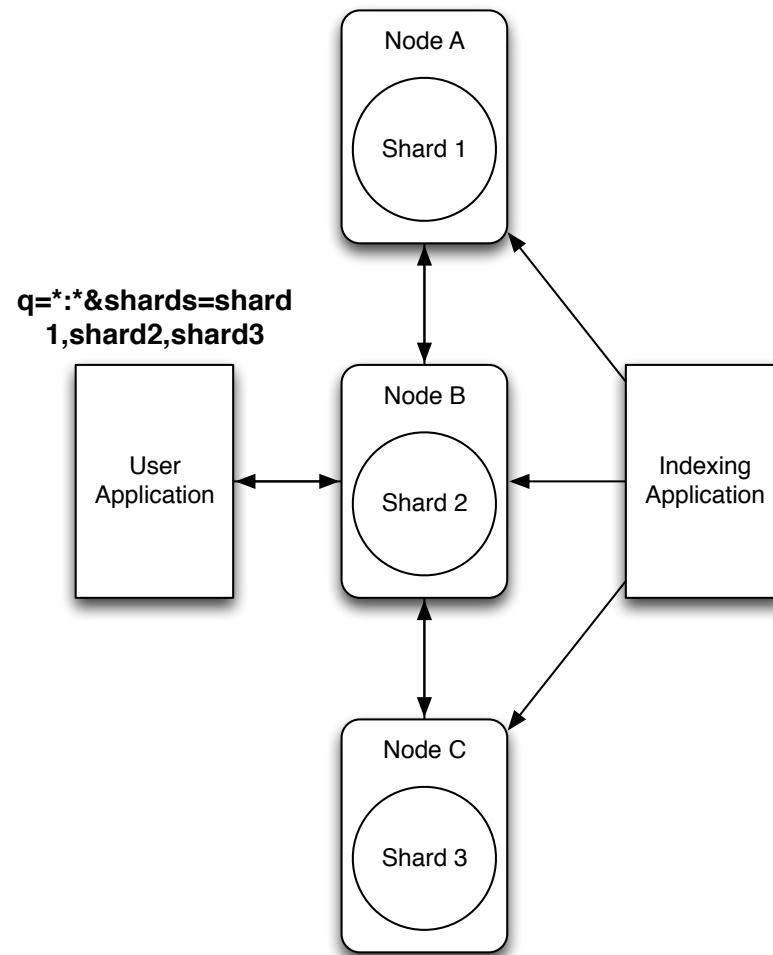

---

Tuesday, February 26, 13

Ryan

# How Does Solr Scale?

---

Tuesday, February 26, 13

Ryan

The index is broken into shards. Essentially these are slices of the index. When users create distributed queries, the query is sent to all shards that make up the logical index. Query results are merged and returned to the client. Many Solr clusters in production today look this way.

# Core Pre-Cloud Issues

---

- Manually managing shard creation (make sure the config files are the same across the cluster!)
- Manually managing replication/backup
- Manually managing index partitioning
- Manually managing query balancing

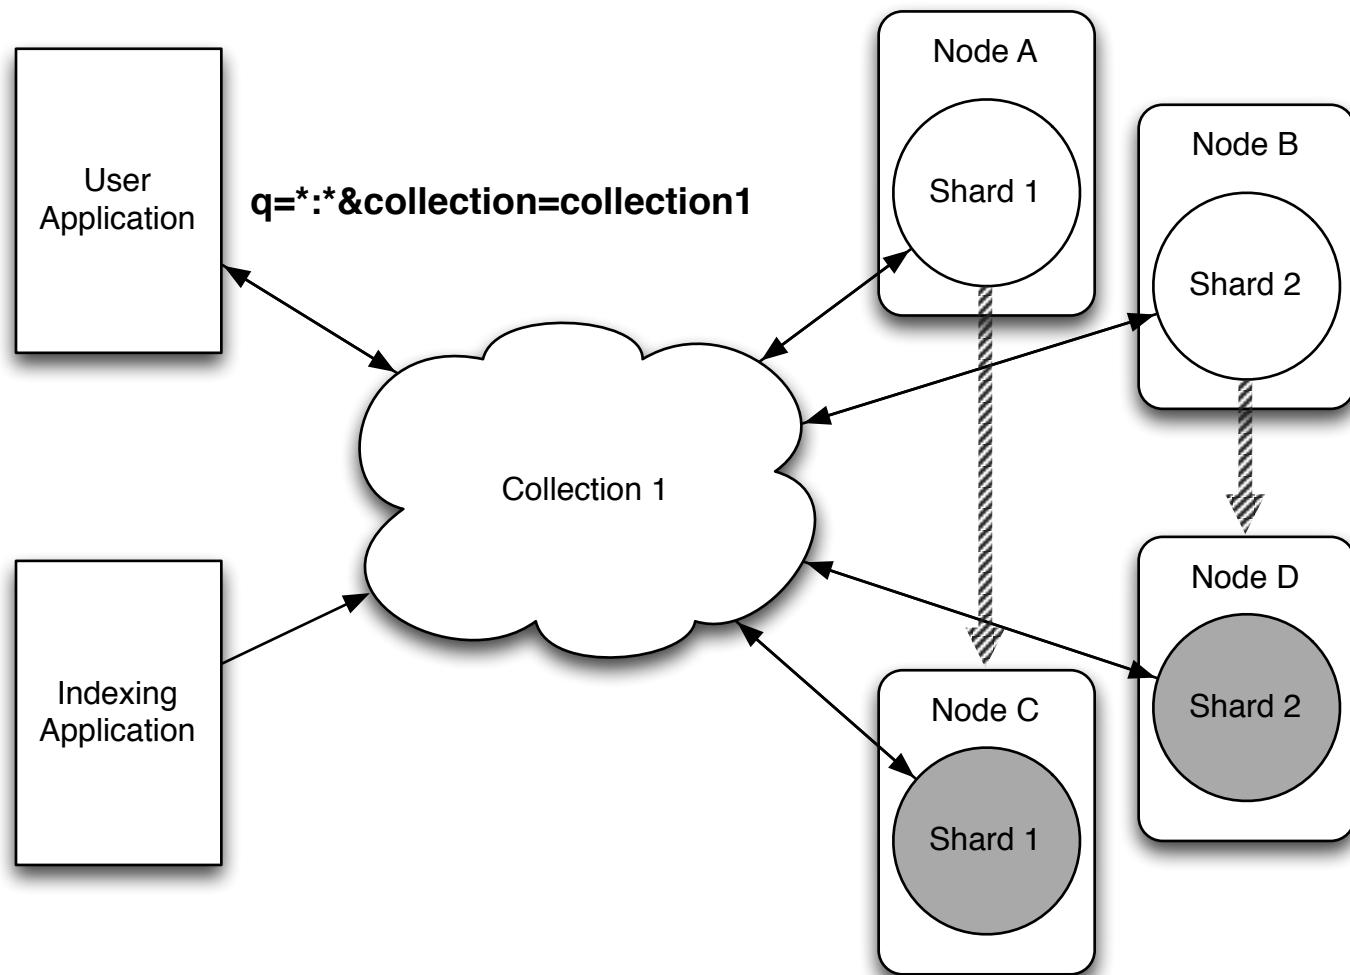

---

Tuesday, February 26, 13

Ryan

# Introducing SolrCloud

---

Tuesday, February 26, 13

Ryan

SolrCloud focuses on handling the sharding logic automatically. Instead of querying a set of shards, we now query a collection. Replicas are created automatically.

# Core Cloud Features

---

- Automatically generates replica cores
- Automatically partitions your index
- Handles syncing index between cores and their replicas
- Load balances queries to cores and their replicas
- Centralized schema management across cores
- Integrating ZooKeeper
- Introduces a transaction log for write durability

---

Tuesday, February 26, 13

Ryan

# Distributed Solr Limitations

---

- Fixed number of shards (Adding more nodes)
- Join
- Distributed Term Frequency
- Query Elevation Component
- More Like This
- Still a work in progress

---

Tuesday, February 26, 13

Ryan

---

- Use SpellCheckComponent
- Spellcheck/suggest is built from an existing index
- Can be set to automatically rebuild the suggest index on commit

---

Tuesday, February 26, 13

Jason

# Prefix Auto Suggest

---

- It is recommended to use FSTLookup or WFSTLookup
- They are more memory efficient

---

Tuesday, February 26, 13

Jason

# Auto Suggest Parameters

---

- Spellcheck = true
- Spellcheck.dictionary = suggest
- Spellcheck.onlyMorePopular = true
- Spellcheck.count = 5 (number of returned suggestions)
- StringField = UTF8Type

---

Tuesday, February 26, 13

Jason

# AutoSuggest by Popular Queries

---

- Prefix based auto-suggest can be limiting
- Use EdgeNGramFilterFactor to query within terms
- Sort Results by a hit count field

---

Tuesday, February 26, 13

Jason

# Dismax Query Parser

---

- Dismax query parser provides query time field level boosting granularity, with less special syntax
- Dismax generally makes the best first choice query parser for user facing Solr applications
- Boosting is the ability to increase the relevance of terms from specific fields over others

---

Tuesday, February 26, 13

Jason

---

# Example Use Case

---

Search and Real Time Analytics on Big Data

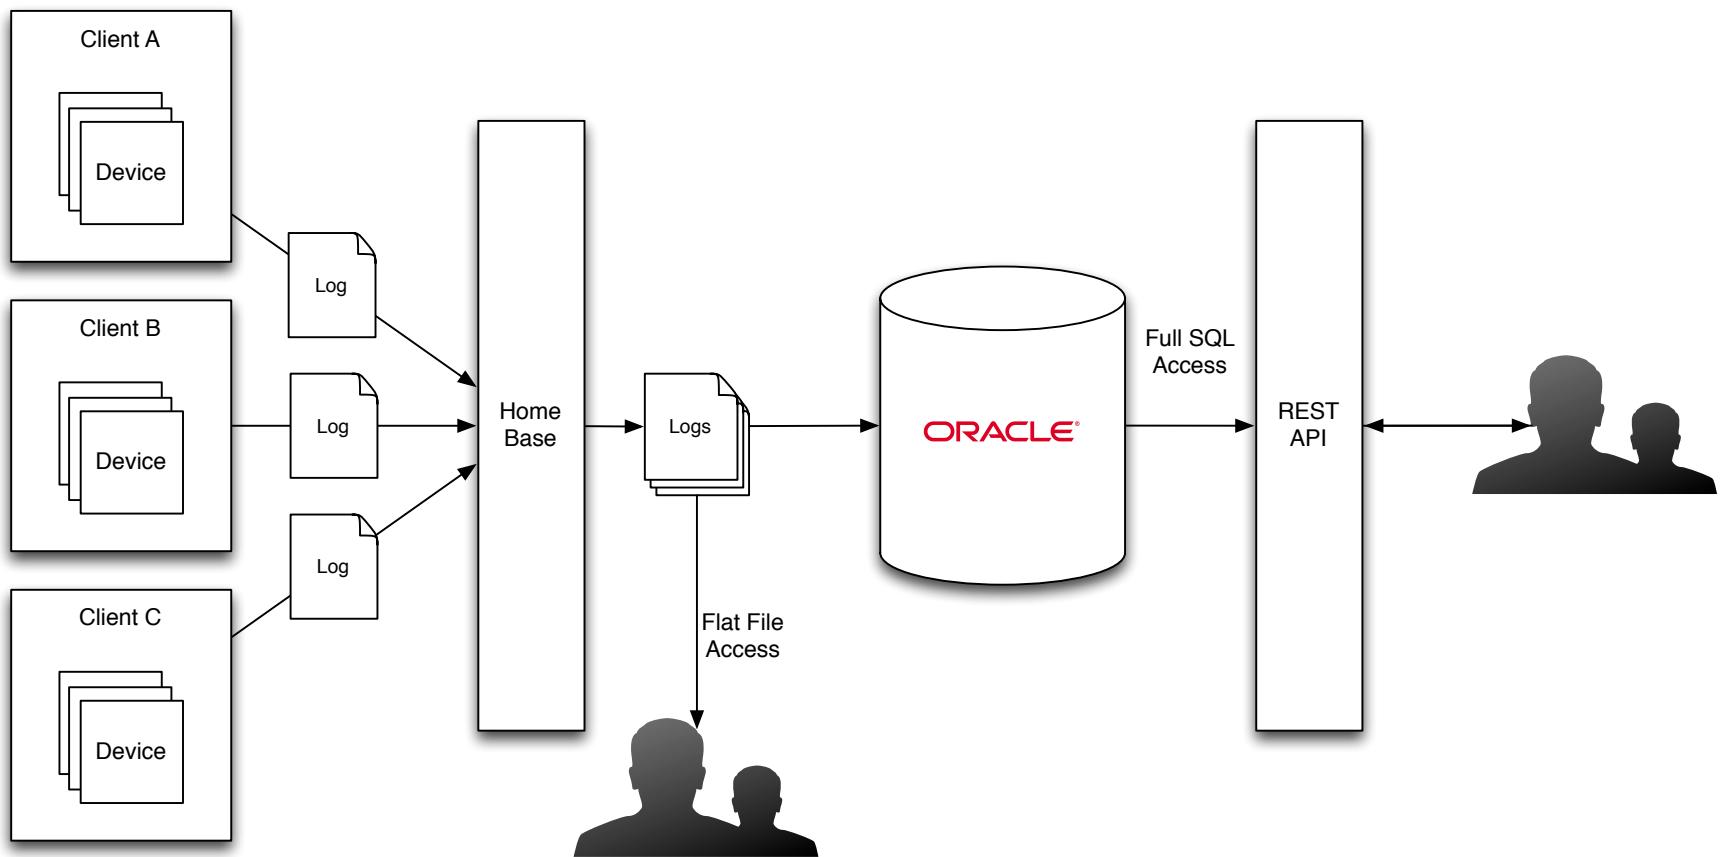

---

Tuesday, February 26, 13

Ryan

# Use Case: Device Data

---

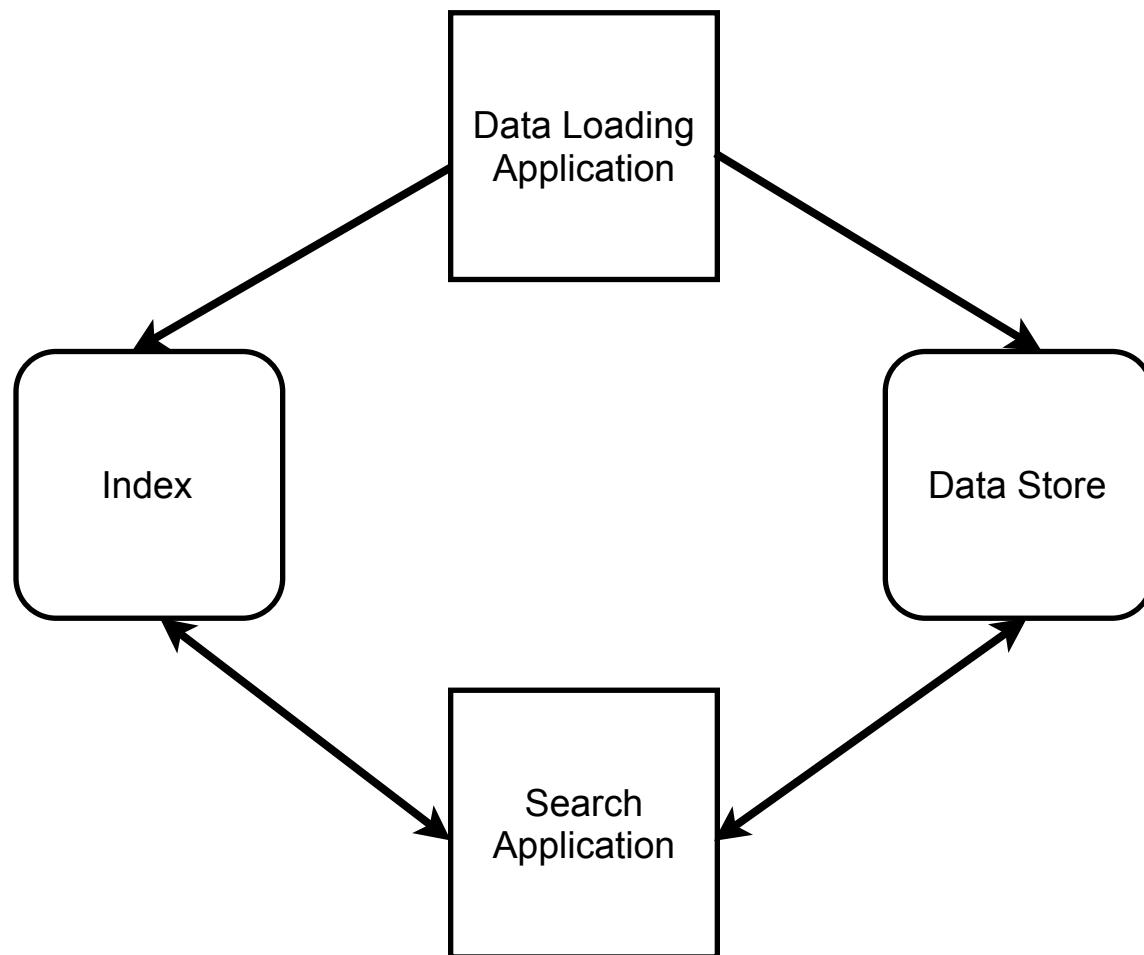

Tuesday, February 26, 13

Ryan

Billions of incoming logs increasing greatly over time  
Each log is a significant file size (<10MB)  
Required to index many attributes for each log  
Required to store parsed and raw log data

# So What Do We Need To Build?

---

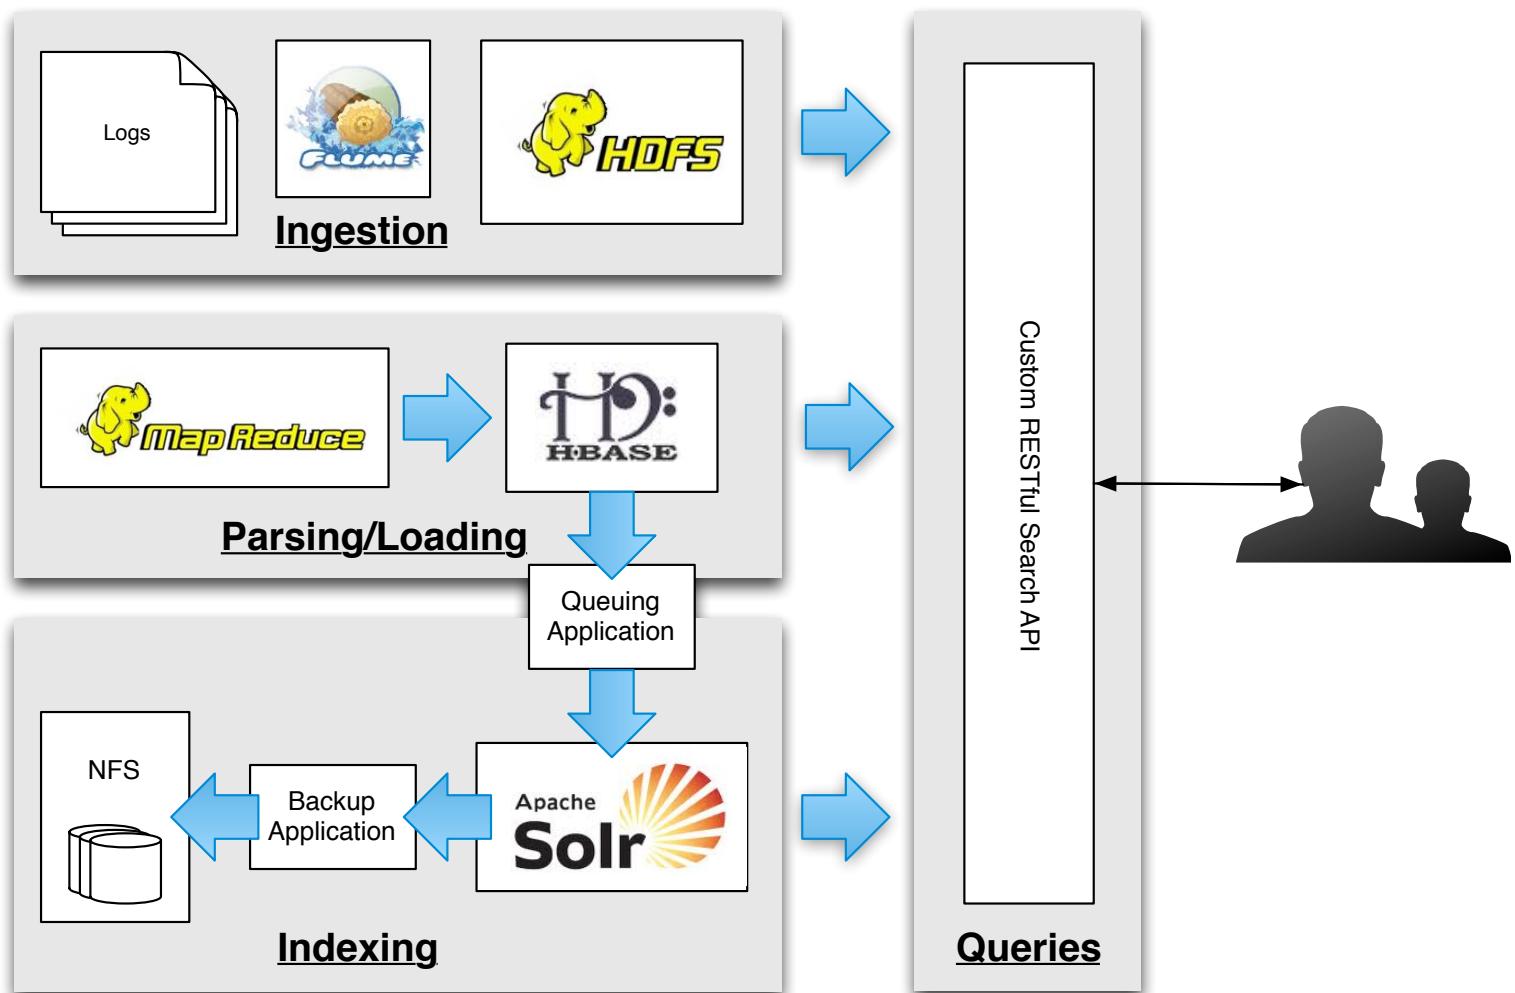

Tuesday, February 26, 13

Ryan

# So What DID We Build?

---

Tuesday, February 26, 13

Ryan

Disclaimer: This was designed and built PRIOR to the announcement of SolrCloud/DSE 2.0.

After those, we really didnt need the queueing application or the backup application

# The Search Application

---

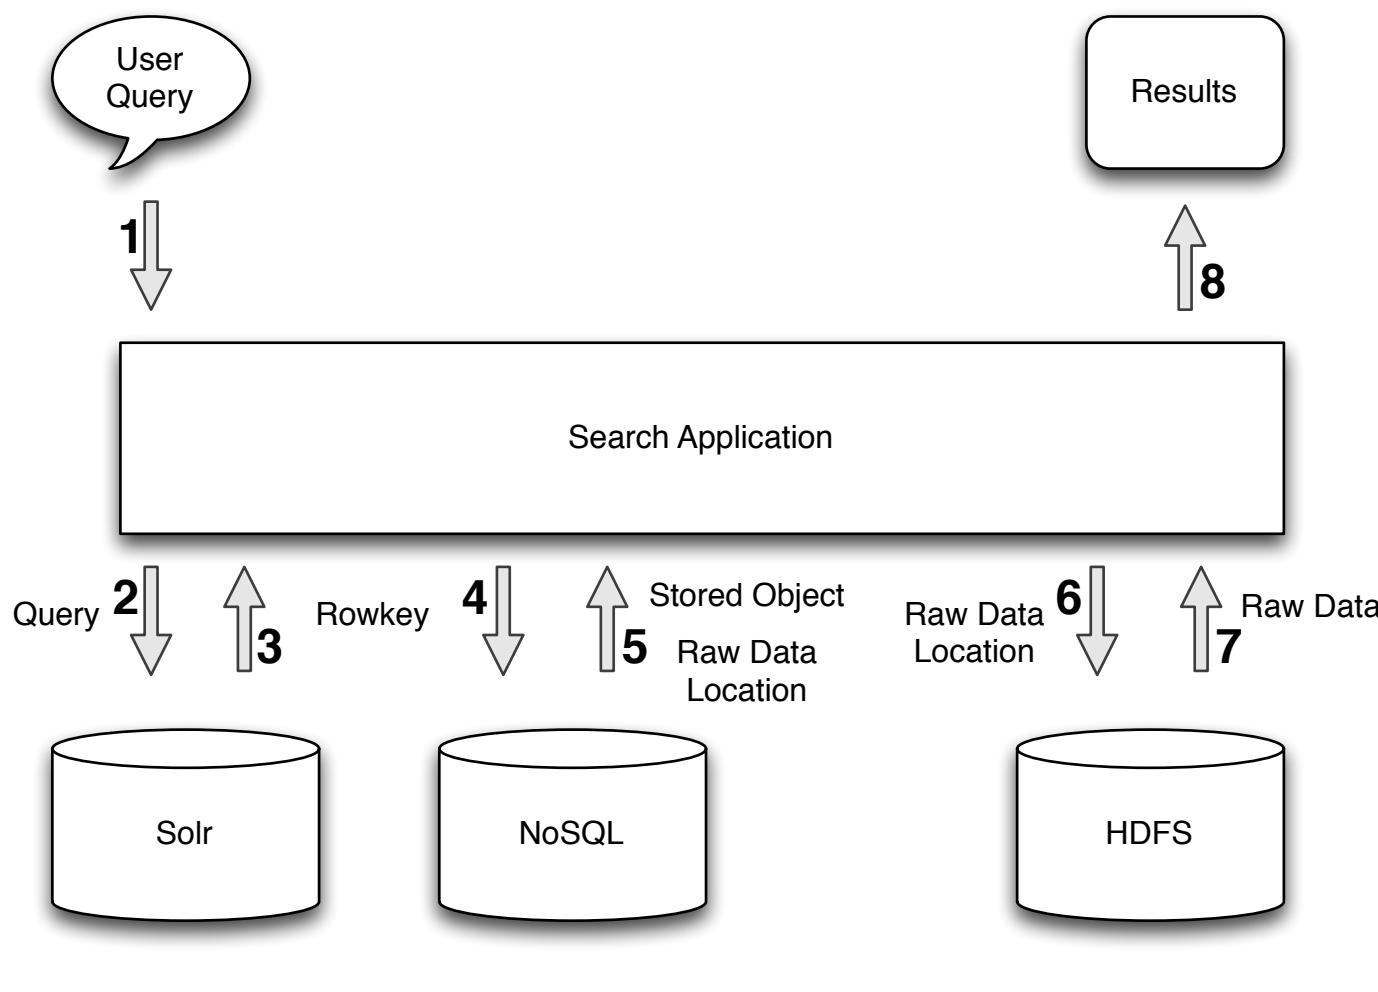

- Searching on log subject lines across install base
- Searching on latest logs across all machines for a given customer that have created support tickets
- Retrieving the raw log data for a given section in a log for a cluster

---

Tuesday, February 26, 13

Ryan

# What About the Raw Files?

Tuesday, February 26, 13

Ryan

. User Query

+

The user would send an HTTP formatted query to the REST API.

. Solr Query

+

The user defined query string would then be translated into a Solr query. Each API was very unique so a generic Solr class was required that would take in a generic set of attributes and create the proper Solr query from it.

. Rowkey

+

The SolrDocuments contained in the Solr response included the unique rowkey that identified ASUPs in the HBase schema.

. HBase Query

+

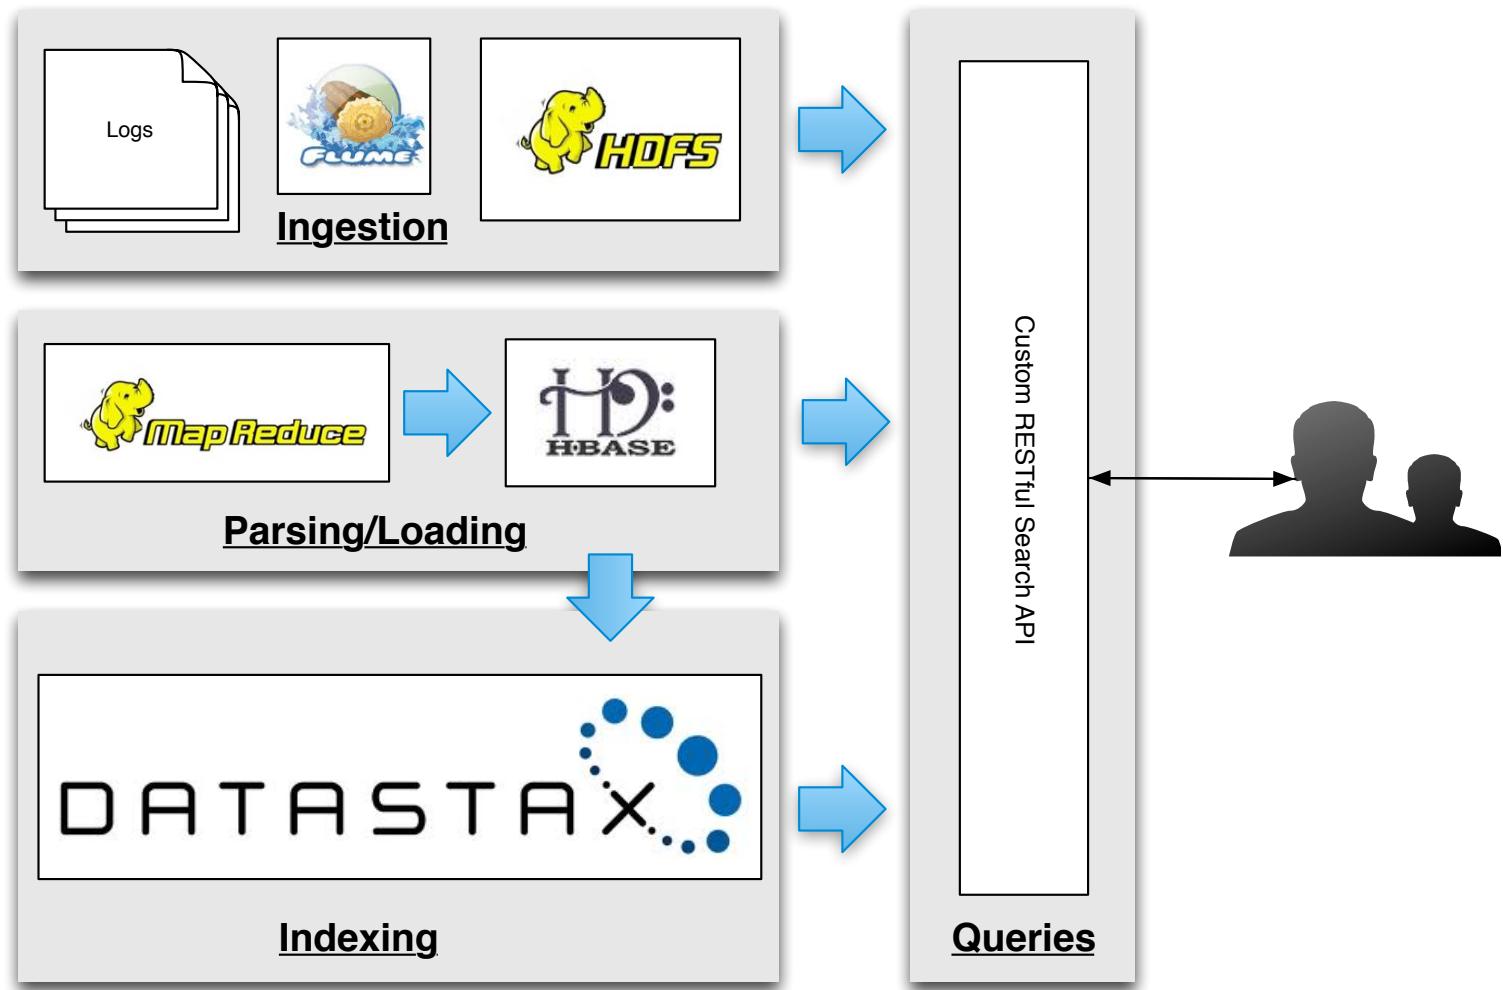

The REST API would then gather all of the rowkeys contained in the Solr response and use those to query HBase.

. Stored Object/Raw Data Location

+

The HBase response included not only the stored object for each ASUP but also a pointer to the location of the raw ASUP file located in HDFS.

# Then Came DSE 2.0 + SolrCloud

Tuesday, February 26, 13

Ryan

After the previously described architecture was finalized, DataStax announced DataStax Enterprise 2.0 which had integrated Solr into Cassandra. The team eventually decided to move forward with DataStax Enterprise for several reasons:

- \* Commercially Supported – Apache SolrCloud is still relatively new and not supported. Standard sharding through Apache Solr required a great amount of custom code, which is not always very supportable.
- \* Failure Tolerance via Cassandra – Since the indexed data is stored in Cassandra, you can lose a node without losing any data. In standard Apache Solr, losing a node meant losing a portion of your index. Dozens of nodes = dozens of single points of failure.
- \* Automatic Reindexing from Stored Data – DataStax Enterprise can automatically reindex based off of the data stored in Cassandra. This meant they could change the schema whenever they wanted and reindex automatically.
- \* Ease of Adding Nodes to the Cluster – Adding a Solr Shard is as easy as adding a node to Cassandra. No need to manually reindex or manually load balance. It is all taken care of within DataStax.
- \* Complete support for Solr – DataStax Enterprise supports all of the features included in Solr 4.0. Code developed against Apache Solr would be 100% compatible with DataStax Enterprise Solr.
- \* Data Storage – If necessary the raw data could be stored in Cassandra, a

---

# Performance Tuning

---

Search and Real Time Analytics on Big Data

---

Tuesday, February 26, 13

# Near Real Time Search

---

- Hard Commit: Performs fsync to disk
  - ▶ Slower availability in query
  - ▶ Greater reliability if node goes down
- Soft Commit: Does not fsync, straight to memory
  - ▶ Near real time indexing
  - ▶ Only reliability up to latest hard commit
- For real time use cases, we usually soft commit frequently (sub second) and hard commit every few minutes.

---

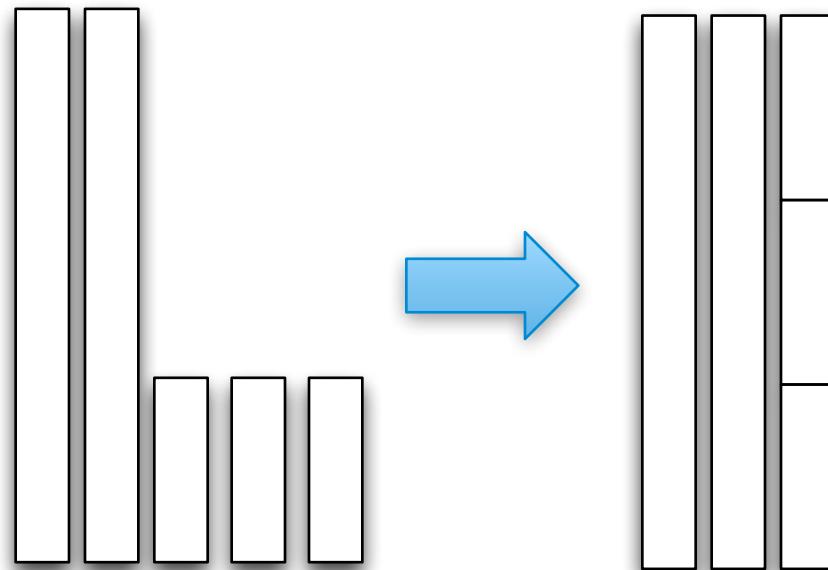

Tuesday, February 26, 13

Jason

# Remember Segments?

---

- Log structured merge tree
- Written once and immutable
- Segments merge as the index grows

Tuesday, February 26, 13

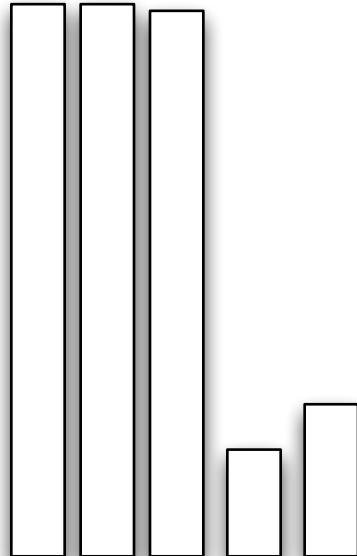

Jason

# Segment Size Trade-Offs

---

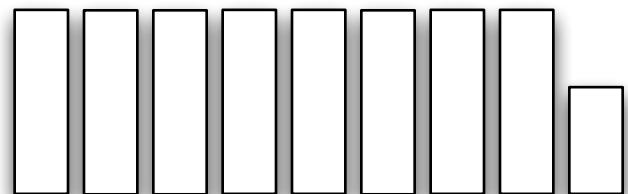

## Few Large Segments

- Faster Queries
- Slower Indexing

## Many Small Segments

- Slower Queries
- Faster Indexing

Tuesday, February 26, 13

Jason

You can set the Lucene segment merge ratio in the SolrConfig file  
Few larger segments mean you dont have to query as many segments, but you will be constantly merging  
Many small segments mean you will not have to merge as often, but your queries will have to iterate over many segments

# Optimizing

---

- Merges all of the Lucene indexes to one segment
- Rewrites the entire index, careful!
- Let Lucene handle segment merging instead

---

Tuesday, February 26, 13

# System IO Cache

---

- Most Lucene operations rely on the operating system IO cache to keep the index effectively ‘in-ram’
- Lucene relies on fast random access which ram provides
- Buy more RAM, fast IO

# Solr and Lucene

---

- Advanced text search and more
- Real time analytics
- Rich SQL like functionality
- Excellent as a secondary indexing system
- Ability to scale
- Open source
- Integration with NoSQL is already happening
